

ArtificialIntelligence Definitions
Artificial Intelligence is...

"... the science and engineering of making intelligent machines" ... "[where] intelligence is the computational part of the ability to achieve goals in the world" (original definition by John McCarthy who coined the term 'Artificial Intelligence' in 1955)

"... making a machine behave in ways that would be called intelligent if a human were so behaving" (alternative definition by John McCarthy who coined the term 'Artificial Intelligence' in 1955)

"... the science of making machines do things that would require intelligence if done by men" (definition offered by A.I. pioneer Marvin Minsky in 1968)

"... the science of making machines smart" (Demis Hassabis, CEO and founder of DeepMind, now part of Google)

"... is an intelligent machine" (Google's Avinash Kaushik)

"... is the next, logical step in computing: a program that can figure out things for itself. It's a program that can reprogram itself" (Jim Sterne, author of Artificial Intelligence for Marketing)

"... anything a machine does to respond to its environment to maximize its chances of success" (Steven Struhl, author of Artificial Intelligence Marketing and Predicting Consumer Choice)

"... technologies emerging today that can understand, learn, and then act based on that information" (PwC's definition)

"... anything that makes machines act more intelligently" (IBM's definition)

"... a constellation of technologies that extend human capabilities by sensing, comprehending, acting and learning - allowing people to do much more" (Accenture's definition)

"... getting computers to do tasks that would normally require human intelligence" (Deloitte's definition)

"... the ability of machines to exhibit human-like intelligence" (McKinsey's definition)

"... a field of computer science that focuses on creating machines that can learn, recognize, predict, plan, and recommend - plus understand and respond to images and language (Salesforce's definition).

"... technology that thinks and acts like humans" (popular business use of the term as reported in a 2015 Narrative Science survey)

"... a subfield of computer science aimed at the development of computers capable of doing things that are normally done by people - in particular, things associated with people acting intelligently" (Definition in Practical A.I. for Dummies)

"... the replication of human analytical and/or decision-making capabilities" Steven Finlay (Author of Artificial Intelligence and Machine Learning for Business, 2017)

"... the ability of a digital computer or computer-controlled robot to perform tasks commonly associated with intelligent beings" (definition in Encyclopedia Britannica by Prof. B.J. Copeland)

"... a set of computer science techniques that enable systems to perform tasks normally requiring human intelligence" Economist Intelligence Unit's definition

"... a computerized system that exhibits behavior that is commonly thought of as requiring intelligence" US Government definition (NSTC)

"... intelligence demonstrated by a machine or by software...[where] intelligence measures an agent's general ability to achieve goals in a wide range of environments" (Calum Chase, author of Surviving A.I.)
